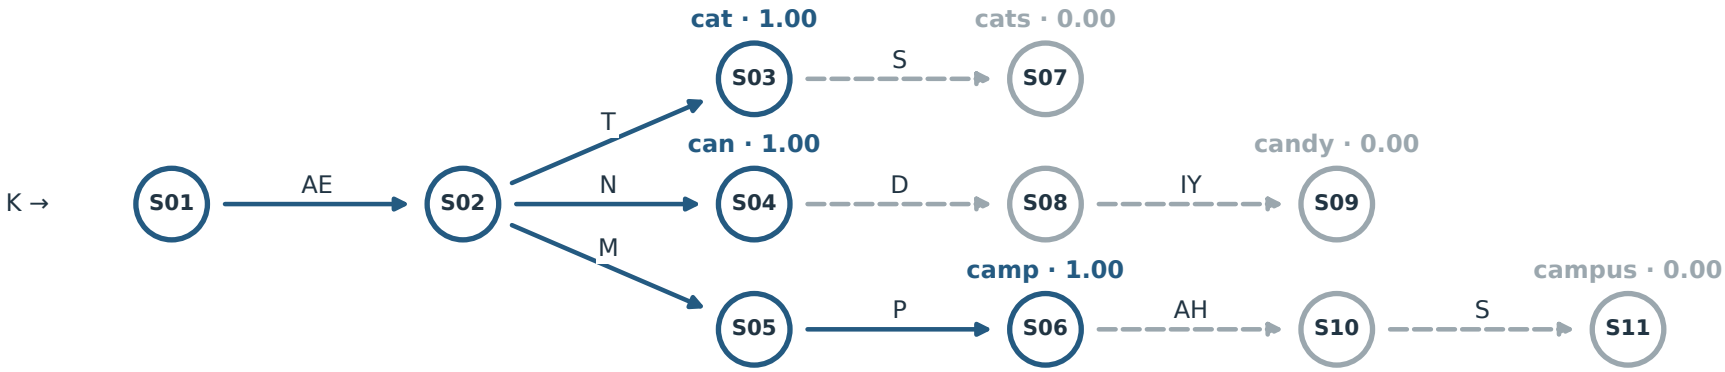
Observed neural paths through lexical extension

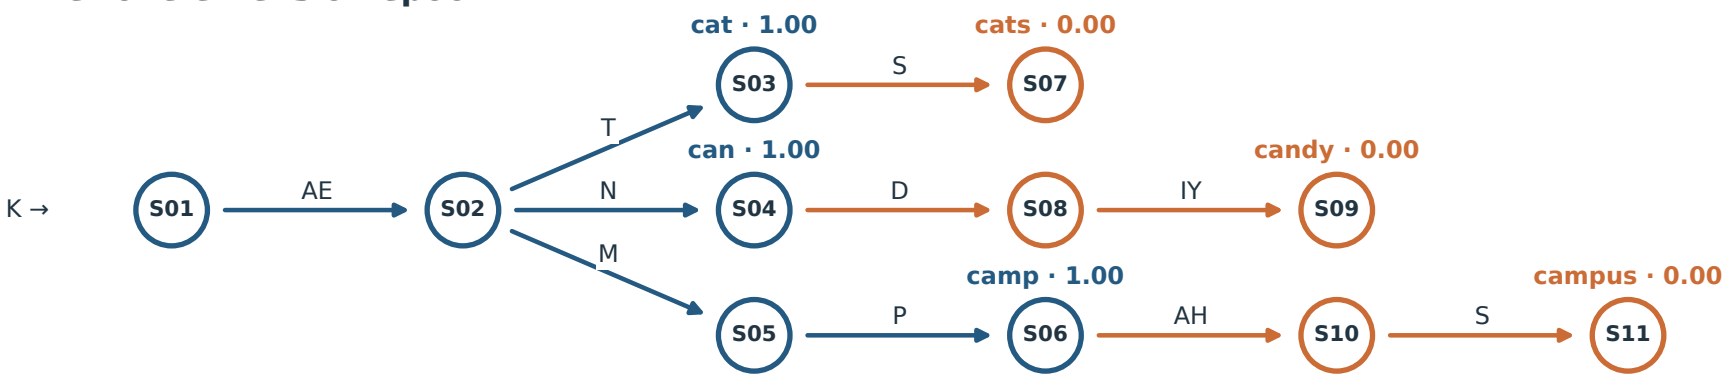
Six-word view of a 36-word network · fixed layout · each node is an observed 30-neuron S population

A Before extension



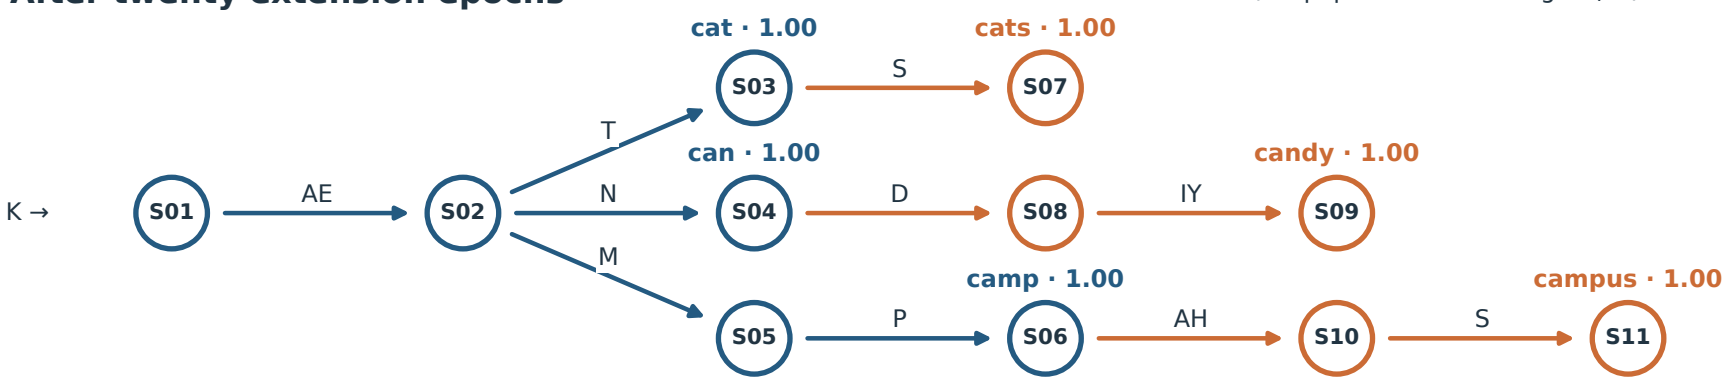
B After one extension epoch

11/11 populations unchanged (30/30 members)



C After twenty extension epochs

11/11 populations unchanged (30/30 members)



Previously trained prefix Extension suffix Untrained suffix probe

Word labels report target W-population overlap (not a probability). Node IDs track exact S-neuron membership.
